The Voyager is known for its ease of use, reliability, and compatibility with various types of vehicles and trailers.

Key Features of Tekonsha Voyager

- Proportional Braking: Adjusts the braking force based on how hard the driver presses the brake pedal.
- Automatic Leveling: The internal sensor detects the angle of the vehicle and adjusts the braking accordingly.
- LED Indicator: Provides visual feedback on the status of the trailer's brakes.
- Simple Installation: Designed for ease of installation in most vehicle types.

Components Needed for Installation

Before diving into the wiring diagram, it's essential to gather all the necessary components for installing the Tekonsha Voyager:

1. Tekonsha Voyager Brake Controller: The main device itself.
2. Vehicle-Specific Wiring Harness: Depending on your vehicle model, a specific wiring harness may be required.
3. Basic Tools: Wire cutters, connectors, screwdrivers, and electrical tape.
4. Fuse: A suitable fuse for the brake controller's power supply.
5. Mounting Bracket: To securely attach the controller to the vehicle.

Tekonsha Voyager Wiring Diagram Overview

The wiring diagram for the Tekonsha Voyager typically involves connecting several wires from the brake controller to the vehicle's electrical system. The primary connections include:

- Power Supply: Connects to the vehicle's battery.
- Ground Wire: Connects to the vehicle's chassis.
- Brake Signal Wire: Connects to the brake light circuit.
- Output Wire to Trailer Brakes: Sends braking signals to the trailer.

Color-Coded Wire Connections

The Tekonsha Voyager wiring diagram uses a color-coded system to simplify connections. Here are the standard wire colors and their functions:

- Black Wire: Connects to the positive side of the battery (12V power supply).
- White Wire: Connects to the ground (vehicle chassis).
- Red Wire: Connects to the brake light switch (brake signal).
- Blue Wire: Connects to the trailer brakes (output to the trailer).

Installation Steps for Tekonsha Voyager

Installing the Tekonsha Voyager brake controller involves several systematic steps. Follow these instructions for a successful installation:

Step 1: Prepare the Vehicle

- Park the vehicle on a level surface and ensure the ignition is off.
- Disconnect the vehicle's battery to prevent any electrical shorts during installation.

Step 2: Mount the Brake Controller

- Choose a location for the brake controller within reach of the driver.
- Use the mounting bracket to secure the controller in place, ensuring it is at a suitable angle for operation.

Step 3: Connect the Wiring Harness

1. Power Connection:
 - Connect the black wire from the brake controller to the positive terminal on the vehicle battery.
 - Use a fuse holder to protect the circuit.
2. Ground Connection:
 - Connect the white ground wire to a clean metal surface on the vehicle's chassis.
3. Brake Signal:
 - Identify the brake light switch (usually located above the brake pedal).
 - Connect the red wire to the brake switch terminal that activates when the brake is pressed.

4. Trailer Brake Output:

- Connect the blue wire to the trailer brake output wire, which leads to the trailer's brake system.

Step 4: Finalize Connections

- Ensure that all connections are secure and insulated with electrical tape to prevent shorts.
- Reconnect the vehicle's battery.

Step 5: Test the System

- With the vehicle running, press the brake pedal to test the functionality of the brake controller.
- Use a multimeter to verify that voltage is reaching the trailer brakes when the brake pedal is engaged.

Troubleshooting Common Issues

Even with careful installation, issues may arise. Here are common problems and their solutions:

Problem 1: Brake Controller Not Activating

- Solution: Check the connections for the power supply, ground, and brake signal. Ensure that the wiring is intact and that the fuse is not blown.

Problem 2: Inconsistent Braking Performance

- Solution: Inspect the trailer brake wiring for frays or breaks. Adjust the sensitivity settings on the controller if available.

Problem 3: LED Indicator Not Functioning

- Solution: Ensure that the controller is receiving power. Check all wiring connections and replace the controller if necessary.
