Sample Solutions and Explanations from the Answer Key

The **unit 3 worksheet 2 chemistry answer key** typically includes detailed explanations alongside correct answers to facilitate deeper understanding. Below are examples of common question types and their solutions.

Example 1: Calculating Atomic Particles

Question: Determine the number of protons, neutrons, and electrons in an isotope of carbon with a mass number of 14.

Answer: Carbon has an atomic number of 6, which means it has 6 protons and 6 electrons. The number of neutrons is calculated by subtracting the atomic number from the mass number: $14 - 6 = 8$ neutrons.

Example 2: Balancing Chemical Equations

Question: Balance the following reaction: $\text{H}_2 + \text{O}_2 \rightarrow \text{H}_2\text{O}$

Answer: The balanced equation is $2\text{H}_2 + \text{O}_2 \rightarrow 2\text{H}_2\text{O}$. This ensures the same number of hydrogen and oxygen atoms on both sides of the equation.

Example 3: Predicting Molecular Geometry

Question: What is the molecular shape of methane (CH_4)?

Answer: Methane has a tetrahedral geometry with bond angles of approximately 109.5° , according to the VSEPR theory, due to the four bonded electron pairs around the central carbon atom.
