## Understanding the Volume of a Cylinder

The volume of a cylinder represents the amount of three-dimensional space enclosed within the cylinder. It is a fundamental concept in geometry and is widely applied in various fields such as engineering, architecture, and everyday problem-solving. The volume calculation involves multiplying the area of the circular base by the height of the cylinder. This relationship is expressed mathematically by the formula:

$$V = \pi r^2 h$$

where  $V$  denotes volume,  $r$  is the radius of the circular base,  $h$  is the height, and  $\pi$  (pi) is approximately 3.14159. Understanding this formula is critical for completing any volume of a cylinder worksheet accurately.

## Key Terms and Definitions

Before solving problems involving the volume of a cylinder, it is important to familiarize oneself with key terms:

- **Radius (r):** The distance from the center of the circular base to its edge.

- **Height (h):** The perpendicular distance between the two circular bases of the cylinder.
- **Pi ( $\pi$ ):** A mathematical constant approximately equal to 3.14159, used to calculate circular dimensions.
- **Volume (V):** The measure of space occupied by the cylinder.

## Sample Problems and Worked Solutions

To illustrate the practical use of the volume of a cylinder worksheet answer key, sample problems with detailed worked solutions are essential. These examples demonstrate the application of the formula and problem-solving strategies.

### Sample Problem 1: Basic Volume Calculation

*Problem:* Find the volume of a cylinder with a radius of 4 inches and a height of 10 inches.

*Solution:* Using the formula  $V = \pi r^2 h$ , substitute the values:

$$V = \pi \times (4 \text{ in})^2 \times 10 \text{ in} = \pi \times 16 \text{ in}^2 \times 10 \text{ in} = 160\pi \text{ in}^3.$$

Approximating  $\pi$  as 3.14159,

$$V \approx 160 \times 3.14159 = 502.65 \text{ cubic inches.}$$

## Sample Problem 2: Word Problem

*Problem:* A cylindrical water tank has a diameter of 6 feet and a height of 12 feet. What is the volume of the tank in cubic feet?

*Solution:* First, find the radius by dividing the diameter by 2:

$$r = 6 \text{ ft} \div 2 = 3 \text{ ft.}$$

Then, calculate the volume:

$$V = \pi \times (3 \text{ ft})^2 \times 12 \text{ ft} = \pi \times 9 \text{ ft}^2 \times 12 \text{ ft} = 108\pi \text{ ft}^3.$$

Approximated volume:

$$V \approx 108 \times 3.14159 = 339.29 \text{ cubic feet.}$$

## Sample Problem 3: Missing Dimension Calculation

*Problem:* The volume of a cylinder is 314 cubic centimeters, and the height is 5 cm. Find the radius of the base.

*Solution:* Use the formula and solve for r:

$$V = \pi r^2 h \rightarrow 314 = \pi r^2 \times 5$$

Divide both sides by  $5\pi$ :

$$r^2 = 314 / (5 \times \pi) \approx 314 / 15.70795 \approx 20.$$

Take the square root:

$$r \approx \sqrt{20} \approx 4.47 \text{ cm.}$$
