Below is a breakdown of the primary components of a Wayne Dalton garage door system.

1. Door Panels

The door panels are the most visible components of the garage door. They are available in various materials such as steel, wood, aluminum, and fiberglass. Each material has its advantages, such as insulation properties, durability, and aesthetic appeal.

- Steel Panels: Offer durability and low maintenance.
- Wood Panels: Provide a classic look but require more maintenance.
- Aluminum Panels: Lightweight and resistant to rust.
- Fiberglass Panels: Good insulation properties and available in various styles.

2. Tracks

Tracks guide the door as it opens and closes. They are typically made of steel and must be installed correctly to ensure smooth operation.

- Vertical Tracks: Located on the sides of the garage door.

3. Rollers

Rollers are mounted on the edges of the door panels and glide along the tracks. They are crucial for the smooth operation of the garage door.

5. Cables

Cables connect the door to the springs, allowing for smooth movement. They help to lift the door by transferring the energy from the springs to the door panels.

6. Hinges

Hinges connect the various panels together, allowing them to bend and fold as the door opens and closes. They are essential for sectional garage doors.

7. Operator System

The operator system, commonly known as the garage door opener, is powered by electricity and is responsible for automatically opening and closing the door. It includes:

- Motor: Drives the mechanism.
