Operation Guidelines

Operating the Wemco Pump Model C effectively requires an understanding of its controls and features.

Starting the Pump

- Ensure that all safety switches are in the correct position.
- Check that the pump casing is full of fluid to prevent damage from running dry.
- Gradually increase the motor speed to avoid sudden pressure surges.

Monitoring Performance

- Regularly check the following parameters:
- Flow Rate: Ensure it meets the expected output.
- Pressure Levels: Monitor both inlet and outlet pressures to detect any abnormalities.
- Vibration Levels: Excessive vibrations can indicate misalignment or wear.

Common Operating Issues

1. Cavitation: This occurs when the pump operates at low pressure, leading to vapor bubble formation. To mitigate cavitation:
 - Ensure the inlet pressure is sufficient.
 - Adjust the pump speed or increase the fluid level in the reservoir.
2. Overheating: Excessive heat can damage the motor and pump components. To prevent overheating:
 - Regularly check the cooling system.
 - Ensure proper lubrication of moving parts.
3. Blockages: Solid materials can obstruct the pump. To address this:
 - Regularly inspect and clean the pump and piping.
 - Implement a filtration system to prevent debris from entering the pump.
