Exploration of the Natural World

One of the primary focuses when considering what do first graders learn in science is their exploration of the natural world. This area introduces students to their immediate environment and encourages observation of plants, animals, and various natural phenomena. First graders begin to recognize patterns in nature and understand their surroundings better through sensory experiences and guided discovery.

Observing Plants and Animals

In this subtopic, students learn to identify common plants and animals, noting their characteristics and habitats. They observe how plants grow and what animals need to survive. This encourages awareness of biodiversity and the interconnectedness of living things.

Seasons and Weather Patterns

First graders explore the changes in weather and seasons, understanding how these variations affect the natural world. They learn to describe different types of weather and recognize seasonal changes in plants and animals.

Using Senses to Explore

Young learners use their senses to investigate natural objects and phenomena. Touch, sight, smell, hearing, and sometimes taste are incorporated into activities that build foundational scientific observation skills.

Introduction to Physical Science

Understanding the basics of physical science is a key element of what do first graders learn in science. This includes exploring matter, forces, motion, and energy in ways that are accessible and engaging for young children.

Properties of Matter

Students begin to recognize different states of matter—solids, liquids, and gases—and describe their properties. Simple experiments help illustrate concepts such as texture, weight, and temperature.

Exploring Motion and Forces

First graders learn about movement and forces by observing how objects move and what causes them to change speed or direction. Activities might include pushing, pulling, and rolling objects to see how forces act in everyday life.

Introduction to Energy

Basic concepts of energy are introduced, such as light and heat. Children learn how energy is involved in various activities and how it affects objects around them.

Learning About Living Organisms

When focusing on what do first graders learn in science, the study of living organisms forms a core component. This includes understanding the characteristics of living things and their needs.

Characteristics of Living Things

Students explore what makes something alive, such as growth, reproduction, and response to the environment. This helps differentiate living organisms from nonliving objects.

Needs of Plants and Animals

First graders learn about the essential needs of living organisms, including food, water, air, and shelter. This knowledge fosters empathy and responsibility towards other life forms.

Life Cycles

The concept of life cycles is introduced, showing how plants and animals grow and change over time. Examples like the butterfly or frog life cycle are often used to visually demonstrate these changes.

Basic Earth and Space Science

Earth and space science topics are simplified for first graders, providing an introduction to the planet and the universe beyond. This section addresses fundamental concepts that spark interest in the natural world and astronomy.

Earth Materials

Students learn about earth materials such as soil, rocks, and water. They explore how these materials are part of the environment and their importance to living things.

The Sun, Moon, and Stars

First graders become familiar with the sun as a source of light and warmth. They also observe the moon and stars, learning basic facts about day and night and celestial bodies.

Environmental Awareness

This subtopic introduces young learners to the importance of caring for the Earth, emphasizing conservation and the impact of human activities on the environment.

Developing Scientific Inquiry Skills

Learning what do first graders learn in science also entails fostering early scientific thinking and inquiry skills. These foundational skills prepare students to understand and engage with science critically and creatively.

Asking Questions

Children are encouraged to ask questions about the world around them, which is the first step in scientific inquiry. This nurtures curiosity and a desire to explore.

Making Observations

Observation skills are developed through activities that require students to notice details, compare objects, and record findings using simple tools like magnifying glasses or charts.

Conducting Simple Experiments

First graders participate in guided experiments that illustrate cause and effect. These hands-on activities help them understand the process of testing hypotheses and drawing conclusions.

Communicating Results

Students learn to share their observations and findings through drawings, verbal explanations, or simple written descriptions, fostering communication skills essential to science.

Key Learning Themes in First Grade Science

To summarize the breadth of what first graders learn in science, the curriculum typically highlights several recurring themes that support comprehensive understanding and engagement.

- Observation and description of the natural environment
- Understanding basic physical properties and forces
- Recognition of living organisms and their life processes

- Introduction to Earth's materials and celestial bodies
- Development of inquiry and critical thinking skills
