Once you have set up Zephyr, familiarize yourself with its core features to utilize the tool effectively.

1. Test Case Creation and Management

Creating and managing test cases is at the heart of the testing process in Zephyr. Here's how to do it:

- Creating a Test Case:
 - Navigate to the "Test Cases" tab.
 - Click on "Create Test Case."
 - Fill in the necessary details such as Title, Description, Pre-conditions, and Steps to Execute.
 - Save the test case.
- Organizing Test Cases:
 - Use folders or tags to categorize test cases based on features, modules, or testing types (e.g., functional, regression).
 - Utilize the search and filter functionalities to quickly locate specific test cases.

2. Test Execution

Executing tests is a crucial step in the testing lifecycle. Zephyr allows you to execute tests in multiple ways:

- Manual Execution:
 - Go to the "Test Execution" tab.
 - Select the test cases you want to execute.
 - Update the status (Pass/Fail) and add comments if necessary.
- Automated Execution:
 - Integrate with automation tools like Selenium or Jenkins to run automated tests and import results

back into Zephyr.

- Set up automation execution plans and monitor their execution status.

3. Defect Management

Defect management is tightly integrated with test management in Zephyr. You can report defects directly from test execution results:

- Reporting a Defect:
- After executing a test case, if it fails, click on "Report Defect."
- Fill in the defect details, including severity, priority, and steps to reproduce.
- Link the defect to the corresponding test case for traceability.
